Let our expert machine operators and programmers create your designs and cut them in our new state-of-the-art **water jet cutting system**. The **water jet system** is a computer-controlled cutting process using a stream of highly pressurized water, assisted by abrasive material, passing through a tiny nozzle. The **water jet** can create thin details almost any shape, and achieves high accuracy without burrs or frayed edges. Simply supply your own artwork in virtually any format (blueprints, drawings or electronic files, etc.). Our staff is capable of converting and interpreting this artwork precisely and quickly.

Advantages of water jet technology

- Cuts almost any material
- Cuts complex patterns without tooling or burrs
- Cuts materials as thin as .015" up to 4" thick
- Cutting capability of 60" length x 48" Width
- No heat during process, so part does not undergo distortion
